this collection gives beginners an advanced introduction to the field of international relations and enlarges the understanding of those who have studied international relations theory in the past

during the fifties and the sixties the neoclassical concept of the production function was criticized in numerous papers in particular the aggregation of different capital goods into a single number was reprehended a second essential disadvantage namely the neglect of the time structure of the production process found however relatively little attention while up to the thirties the austrian capital theory which stressed the time aspect of production was an important school it fell into oblivion after the great capital controversies of the thirties it took over thirty years i e till the beginning of the seventies before it came to a renaissance of the austrian capital theory by various writers we may roughly classify the different attempts of its rebirth in modern economics into three groups 1 the approach of 1970 1973 1973a has received most of the attention in the literature burmeister 1974 faber 1975 fehl 1975 1975 hagemann and 1976 it will be shown in chapter 9 that is only in so far as a neo austrian as he does explicitly take into consideration the vertical time structure of the production process but he does not use the austrian concepts of superiority of roundabout methods of time preference and of the period of production 2 the latter concept has been revived by the second group to which tintner 1970 von weizs cker 1971a 1971b 1974 1971 1976 and 1973 1975 1976 belong

during the last fifteen years certain very fundamental aspects of economic theory have been very actively debated the debate has often been called the cambridge controversy since the main participants in the debate come from cambridge usa and cambridge eng land in this debate certain important foundations of economic theory have been criticized which are specifically important for understanding price formation and income distribution an important starting point has been sraffa s extensions of ricardo s theory and one has therefore sometimes called those neo ricardians who have based themselves on sraffa s work we shall deal with some important issues that

have been debated and we shall try to describe a rather complete theoretical construction which will be an alternative to neo classical theory a special problem relates to the title of the book and classification of authors to whom we refer perhaps post keynesian would sometimes be a better label than neo ricardian we have used the latter name for the book due to its large emphasis on sraffa's work to understand the main parts of the book only basic algebra and calculus are necessary

it is a great satisfaction for a mathematician to witness the growth and expansion of a theory in which he has taken some part during its early years when h weyl coined the words classical groups foremost in his mind were their connections with invariant theory which his famous book helped to revive although his approach in that book was deliberately algebraic his interest in these groups directly derived from his pioneering study of the special case in which the scalars are real or complex numbers where for the first time he injected topology into lie theory but ever since the definition of lie groups the analogy between simple classical groups over finite fields and simple classical groups over \mathbb{R} or \mathbb{C} had been observed even if the concept of simplicity was not quite the same in both cases with the discovery of the exceptional simple complex lie algebras by killing and e cartan it was natural to look for corresponding groups over finite fields and already around 1900 this was done by dickson for the exceptional lie algebras g and e however a deep reason for this 2-6 parallelism was missing and it is only chevalley who in 1955 and 1961 discovered that to each complex simple lie algebra corresponds by a uniform process a group scheme f_j over the ring \mathbb{Z} of integers from which for any field k could be derived a group $f_j k$

this work in two parts lecture notes in economics and mathematical systems volume 105 and 106 constitutes the proceedings of the fourteenth biennial seminar of the canadian mathematical congress which was held from august 12 to august 25 1973 at the university of western ontario london ontario the canadian mathematical congress has held biennial seminars since 197 and these have covered a wide range of topics the seminar reported in this publication was concerned with optimal control theory and its applications a subject chosen for its active growth and its wide implications for other fields both these aspects are exemplified in these proceedings some lectures provided excellent surveys of particular fields whereas others concentrated on the presentation of new results there were six distinguished principal lecturers h t banks a r dobell h halkin j l lions r m thrall and w m wonham all of whom gave five to ten lectures during the two weeks of the seminar except for dr dobell's these will all be found in volume 105 besides the principal lecturers

there were three guest lecturers m c delfour v jurdjevic and s p sethi who presented substantial bodies of material in two or three lectures and which are included in volume 106 many of the participants also spoke and reports of 0st of these have also been included volume 106
